# 1 Introduction

This section is based upon:

- Fieldbus FOUNDATION™ Specification "Function Block Application Process Part 1 – 3" Revision 1.7 (FF-890 to FF-892)
- Fieldbus FOUNDATION™ Specification "Positioner Transducer Block" Revision 3.0 (FF-906)

## Type 3738-50 Electronic Limit Switch

The Type 3738-50 Electronic Limit Switch allows on/off valves to be actuated by an integrated or external solenoid valve as well as their discrete end positions to be read out by a FOUNDATION™ fieldbus network according to IEC 61158-2.

Special features:

- Link Master Capability
- Power supplied by FOUNDATION™ fieldbus  
(solenoid valve with low energy consumption of 6 V DC)
- Simple discrete actuation of on/off valves over a FOUNDATION™ fieldbus network
- Easy to attach to commonly available linear actuators (NAMUR attachment) as well as rotary actuators according to VDI/VDE 3845
- Non-contact sensing of the rotation angle by a magnetoresistive sensor system
- Simple one-knob, menu-driven operation
- Automatic start-up
- LCD easy to read in any mounting position due to selectable reading direction
- Integrated diagnostics with partial stroke testing (PST)
- Classified status alarms acc. to NAMUR Recommendation NE 107
- Parameters can be changed online
- Permanent storage of all parameters in non-volatile EEPROM (protection against power failure)
- Version with integrated solenoid valve or for external solenoid valve

## 2 Principle of operation

The electronic limit switch is designed for attachment to pneumatic actuators. The current valve position is measured without contact using a magnet (on a screw) positioned centrically on the actuator shaft. The screw with magnet does not need to be adjusted. The AMR (anisotropic magnetoresistive) sensor located in the device together with the measuring electronics (1) can detect the directional change of the applied magnetic field and, as a result, sense the movement of the actuator.

The pneumatic actuator is operated by a solenoid valve (6, 8) which converts the signal issued by the control system into a binary pressure signal.

### 2.1 Versions

#### Version with integrated solenoid valve (Type 3738-50-xxx4x00x1x00x0)

The solenoid valve is integrated into the housing of the electronic limit switch. The electronic limit switch and the solenoid valve are powered by the connected FOUNDATION™ fieldbus two-wire cable according to IEC 61158-2.

#### Version for external solenoid valve (Type 3738-50-xxx0x00x1x00x0)

The electronic limit switch and the external solenoid valve are powered by the connected FOUNDATION™ fieldbus two-wire cable according to IEC 61158-2.

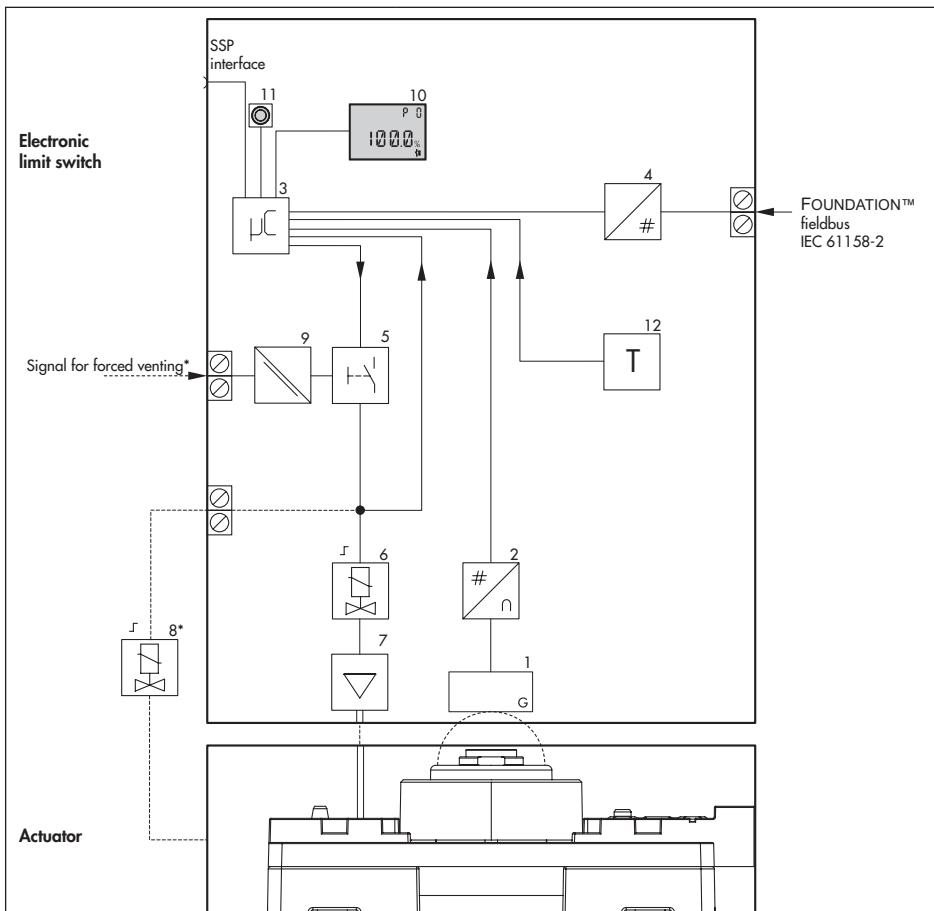

### 2.1.1 Forced venting

The electronic limit switch can optionally be fitted with a **forced venting** function. This function is activated when the solenoid valve is de-energized after the power supply is interrupted, causing the actuator to move the control valve to its fail-safe position.

## 2.2 Operating/configuration mode

The electronic limit switch has two modes: the operating mode (**RUN**) and the configuration mode (**SET**). Switchover between the two modes is performed in the **Operating mode** parameter ► page 40.

- **RUN:** Operating mode: configuration for start-up and partial stroke testing (PST) **not** possible
- **SET:** Configuration mode: (no operation), configuration for start-up and partial stroke testing (PST)

**Fig. 1:** Functional diagram of Type 3738-50 Electronic Limit Switch

### **3 Configuration using TROVIS-VIEW software**

The electronic limit switch can be configured using the TROVIS-VIEW Configuration and Operator Interface software.

The electronic limit switch is equipped with an additional digital serial interface to connect the RS-232 or USB port of the computer to the electronic limit switch over an adapter cable.

The TROVIS-VIEW software enables the user to easily set parameters in the electronic limit switch and view process parameters online.

#### **3.1 Configuration using the NI-BUS™ Configurator**

The NI-FBUS™ Configurator from National Instruments can also be used to configure the electronic limit switch. An FF interface card is required for connection to FOUNDATION™ fieldbus.

The integrated function blocks can be linked using the NI-FBUS™ Configurator.

#### **3.2 Communication**

The electronic limit switch is completely controlled over the digital signal transmission implemented according to FOUNDATION™ fieldbus specification.

Data are transmitted over the bus using digital, bit-synchronous Manchester coding at a baud rate of 31.25 kbit/s over twisted-pair wires according to IEC 61158-2.

---

##### **i Note**

*If complex functions are started in the electronic limit switch, which require a long calculation time or lead to a large quantity of data being saved in the volatile memory of the electronic limit switch, the alert 'busy' is issued over FOUNDATION™ fieldbus. This alert is not an error message and can be simply confirmed.*

---

## 4 FOUNDATION™ fieldbus block model

FOUNDATION™ fieldbus assigns all the functions and data of a device to different types of blocks. Each type of block has a different range of tasks to fulfill in the block model. The following types of blocks are implemented in the SAMSON Type 3738-50 Electronic Limit Switch:

### Resource Block (RES)

The Resource Block contains all the specific characteristics associated with a device on the fieldbus, for example, device name, manufacturer number and serial number. A device can only have one Resource Block.

### Function Blocks (FB)

Function blocks are responsible for the control behavior of a FOUNDATION™ fieldbus device. A FOUNDATION™ fieldbus application can be configured by connecting the inputs and outputs of function blocks. The following function blocks are implemented in the Type 3738-50:

- 5x Discrete Input Function Blocks (DI FB); execution time 20 ms
- 5x Discrete Output Function Blocks (DO FB); execution time 30 ms
- 1x Analog Input Function Block (AI FB)  
analog position feedback; execution time 20 ms

### Transducer Blocks (TRD)

Each AI or AO Function Block has a Transducer Block which contains all data and device-specific parameters to link the device to the process value (sensor or final control element).

The following Transducer Blocks (corresponding to the Function Blocks) are implemented:

- 1x Limit Switch Transducer Block (LS TRD)
- 5x Discrete Input Transducer Blocks (DI TRD)
- 5x Discrete Output Transducer Blocks (DO TRD)
- 1x Analog Input Transducer Block (AI TRD)

## 5 Write protection

The **Local operation** parameter ► page 28 allows the local operation (access using TROVIS-VIEW and on-site operation) of the electronic limit switch to be locked. An active locking is indicated by  on the display.

### Note

*Operation over the FOUNDATION™ fieldbus network can be locked by the local operation (Code P18). When this locking function is active, device data can only be read over the FOUNDATION™ fieldbus network, but data in the device cannot be overwritten.*

## 6 End position calibration in the device

When the zero point or end positions are incorrect, it may be necessary to recalibrate them. Always perform an end position calibration for the fail-safe position and for the operating position. The end position calibration can be started by the **START\_ABORT\_CMD** parameter of the LS Tranducer Block. Status information can be read in the **Status of end position calibration** parameter ► page 38.

The end position calibration is automatically canceled if an error occurs. The error can be read in the **ACTUAL\_DEVICE\_ERROR (70)** parameter of the LS Tranducer Block.

## 7 Resetting the device

### Resetting start-up data

Reset the start-up data in the P21 parameter (local operation).

### Resetting identification data and the block configuration

Reset the identification data for the electronic limit switch, valve and actuator by selecting '3' in the **RESET\_CMD (63)** parameter of the LS Tranducer Block. Additionally, the settings of the function blocks are reset to their default settings. The start-up data and loggings remain saved.

### Resetting the logging of partial stroke testing (PST), valve movement and status

Reset the logged partial stroke testing data, valve movement and logged status messages by selecting '12' in the **RESET\_CMD (63)** parameter of the LS Transducer Block. The device configuration remains saved.

## 8 Status classification and condensed state

All status messages are classified in the electronic limit switch to report an error that has occurred. The status classification can be changed over the DD or in the TROVIS-VIEW software (see Fig. 3).

To provide a better overview, the classified messages are summarized in a condensed state (► page 49). In addition to the parameter, the condensed state can be issued to the discrete output OUT\_D of the Discrete Input Function Blocks (DI1 FB to DI5 FB).

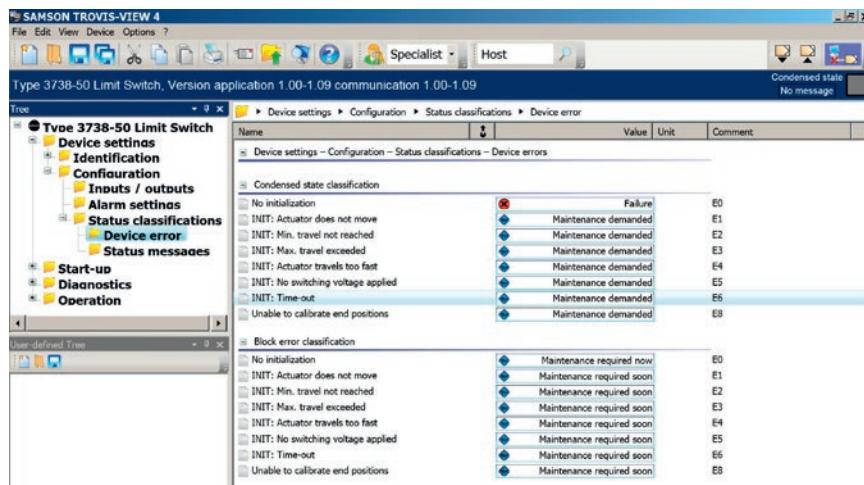

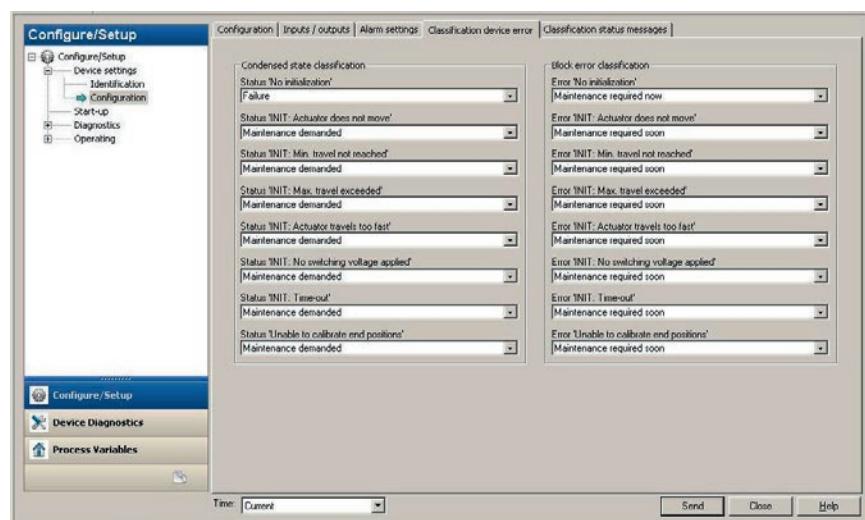

Possible condensed states include:

0	OK	
1	Maintenance required	The device still performs its control task (with restrictions). A maintenance requirement or above average wear has been determined. The wear tolerance will soon be exhausted or is reducing at a faster rate than expected. Maintenance is necessary in the medium term.
2	Maintenance demanded	The device still performs its control task (with restrictions). A maintenance requirement or above average wear has been determined. The wear tolerance will soon be exhausted or is reducing at a faster rate than expected. Maintenance is necessary in the short term.
3	Failure	The device cannot perform its control task due to a functional fault in the device or in one of its peripherals or an initialization has not yet been successfully completed.
4	Out of specification	The device is running outside the specified operating conditions.
7	Function check	Test or calibration procedures are being performed. The device is temporarily unable to perform its control task until this procedure is completed.

In addition to the condensed state, the block error messages (► page 41) from the Resource Block and the Transducer Blocks can also be assigned to events.

The block error is formed from active classified messages.

13

## 9 Block model

Some parameters can only be changed in certain modes (see section 10). In this case, the target mode is decisive and not the actual mode.

### 9.1 Resource Block (RES)

The Resource Block contains all the data that identify the device. It is similar to an electronic device tag. Resource Block parameters include device type, device name, manufacturer ID, serial number as well as parameters that affect the behavior of all other blocks of the device.

**i Note**

All time specifications in the Resource Block are specified in the unit of 1/32 ms according to the FOUNDATION™ fieldbus Specification Version 1.7. In the Device Description Library supplied by Fieldbus FOUNDATION upon which the device description of Type 3738-50 is also based, these parameters are incorrectly specified with the unit of ms. The specified values supplied by the device are, however, always to be interpreted as the unit of 1/32 ms.

## 9.2 Function Blocks

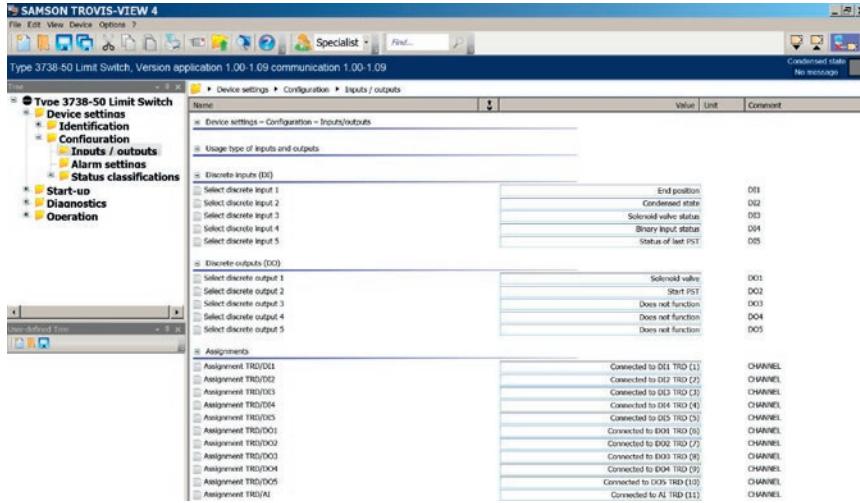

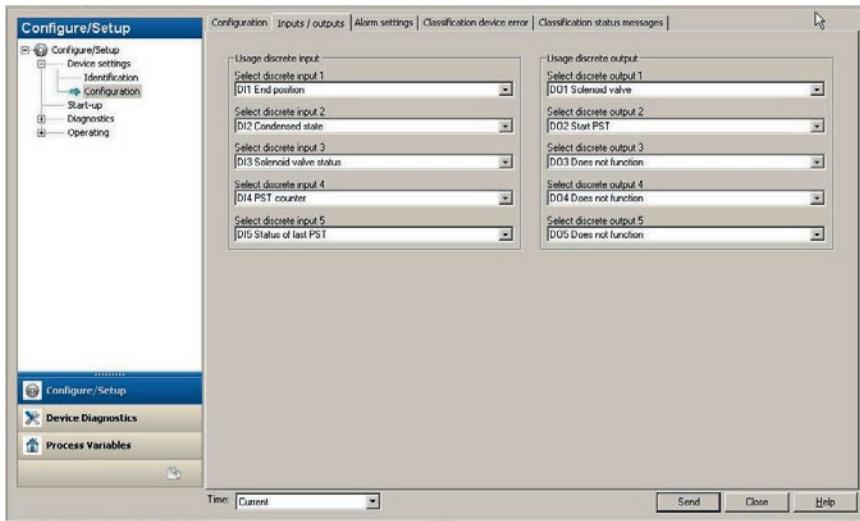

### 9.2.1 Discrete Input Function Block (DI1 FB to DI5 FB)

The Discrete Input Function Block processes single discrete signals and makes them available to other function blocks over the discrete output (OUT\_D). The electronic limit switch has five Discrete Input Function Blocks which provide the application options described below. The type of application is set over **Select discrete input 1 to 5** parameter ► page 29.

– **End position** (default assignment: DI1 FB)

The end position (current discrete valve position) is provided by the discrete output.

- 0 Valve closed
- 1 Valve open
- 2 Valve in intermediate position

**Fig. 4:** Default assignment of Function Blocks DI1 FB to DI5 FB and DO1 FB to DO5 FB using the DD (top) and in TROVIS-VIEW (bottom)

## Block model

- **Condensed state** (default assignment: DI2 FB)

The current condensed state according to NAMUR Recommendation NE 107 is provided by the discrete output.

- 0 No message
- 1 Maintenance required
- 2 Maintenance demanded
- 3 Failure
- 4 Out of specification
- 7 Function check

- **Solenoid valve status** (default assignment: DI3 FB)

The current status of the solenoid valve is provided by the discrete output.

- 0 Not active
- 1 Active

- **Status of last PST** (default assignment: DI5 FB)

The status of the last partial stroke test (PST) is provided by the discrete output.

- 0 No test available
- 1 Successful
- 2 Not successful

- **PST counter** (no default assignment)

The number of partial stroke tests (PST) performed is provided by the discrete output.

### 9.2.2 Discrete Output Function Block (DO1 FB to DO5 FB)

The Discrete Output Function Block processes a discrete signal and makes it available as a discrete output (OUT\_D) at the preset CHANNEL.

The five Discrete Output Function Blocks can be assigned to various applications over the **Select discrete output 1 to 5** parameter ► page 29. The following applications are supported:

- **Solenoid valve** (default assignment: DO1 FB)

- Starts solenoid valve test
- 0 De-energize solenoid valve
  - 1 Energize solenoid valve

- **Start the PST** (default assignment: DO2 FB)

Starts a partial stroke test (PST): the change to a positive edge at the DO output starts the partial stroke test (PST).

0 → 1 Start partial stroke test (PST)

### 9.2.3 Analog Input Function Block (AI FB)

The Analog Input Function Block provides an analog measured variable of the electronic limit switch at its output for other analog function blocks. It is not possible to assign the measured variables. The output is always the valve position.

## 9.3 Transducer Blocks

Transducer blocks link the function blocks to the input and output variables of a field device. For example, the Discrete Input Function Blocks are linked to the physical binary inputs, an internal solenoid valve, the current valve position or the condensed state of the device. This link to the various transducer blocks is made over the CHANNEL parameter of the individual function blocks. The table below shows how CHANNEL is assigned to the function blocks:

CHANNEL	Function block
1	DI1
2	DI2
3	DI3
4	DI4
5	DI5
6	DO1
7	DO2
8	DO3
9	DO4
10	DO5
11	AI

The Transducer Blocks DI TRD, DO TRD and AI TRD are implemented according to the FOUNDATION™ fieldbus specification and do not contain any manufacturer-specific parameters.

## Parameters

### 9.3.1 Limit Switch Transducer Block (LS TRD)

The Limit Switch Transducer Block is not linked to any function blocks. It serves as a container for device-specific parameters. Furthermore, the data of the diagnostic tests are saved here and can be transferred to other transducer blocks.

## 10 Parameters

### Explanation to the following tables

The parameters of the electronic limit switch are arranged in the tables according to the following topics:

- ▶ Identification
- ▶ Configuration
- ▶ Start-up
- ▶ Diagnostics – Status messages
- ▶ Diagnostics – Monitoring funtions
- ▶ Diagnostics – Test functions
- ▶ Process data
- ▶ Operating mode

The default settings for parameters with write protection are written in parentheses [ ].

#### Supported modes:

- O O/S (out of service) mode
- M MAN mode
- A AUTO mode

#### Read/write capability:

- R Read capability
- W Write capability

## Identification

<b>Actuator</b>			
<b>Actuator manufacturer ID</b>

## Parameters

### Start-up

Calibration				
	<b>Transducer calibration date</b>			
Block: LS_TRD	Read/write capability: R/W	Supported modes: O/M/A	DD: XD_CAL_DATE	
	Date of last calibration			
	<b>Transducer calibration location</b>			
Block: LS_TRD	Read/write capability: R/W	Supported modes: O/M/A	DD: XD_CAL_LOC	
	Location of last calibration			
	<b>Transducer calibration who</b>			
Block: LS_TRD	Read/write capability: R/W	Supported modes: O/M/A	DD: XD_CAL_WHO	
	Person who performed the last calibration			
End position calibration				
	<b>Offset in end position calibration</b>			
Block: LS_TRD	Read/write capability: R	Supported modes: –	DD: CORRECTION_VALUE	
	Specified in degrees °			
	<b>Status of end position calibration</b>			
Block: LS_TRD	Read/write capability: R	Supported modes: –	DD: ZERO_POINT_STATUS_ENUM	
	• Not successful • Successful			
	<b>Time stamp, adaption end pos. cal.</b>			
Block: LS_TRD	Read/write capability: R	Supported modes:	DD: ZERO_TIME_STAMP_STRING	
	Reading in d.h:min:sec			

	<b>Time stamp end position calibration</b>		
	Block: LS_TRD	Read/write capability: R	Supported modes: DD: ZERO_PRIM_TIME_STAMP_STRING
	Reading in d.h:min:sec		
<b>Initialization</b>			
	<b>Dead time decreasing</b>		
	Block: LS_TRD	Read/write capability: R	Supported modes: – DD: DEADTIME_OFF
	Reading in sec		
	<b>Dead time increasing</b>		
	Block: LS_TRD	Read/write capability: R	Supported modes: – DD: DEADTIME_ON
	Reading in sec		
	<b>Initialization span</b>		
	Block: LS_TRD	Read/write capability: R	Supported modes: – DD: RANGE
	Specified in degrees °		
	<b>Initialization status</b>		
	Block: LS_TRD	Read/write capability: R	Supported modes: – DD: INIT_STATUS
	<ul style="list-style-type: none"> <li>• Not successful</li> <li>• Automatic initialization</li> <li>• Manual initialization</li> <li>• Active</li> </ul>		
	<b>Time stamp initialization</b>		
	Block: LS_TRD	Read/write capability: R	Supported modes: – DD: INIT_PRIM_TIME_STAMP_SECONDS
	Reading in d.h:min:sec		
	<b>Transit time decreasing</b>		
	Block: LS_TRD	Read/write capability: R	Supported modes: – DD: RUNTIME_OFF
	<ul style="list-style-type: none"> <li>• [0.00] to 100.00</li> </ul>		

## Parameters

	<b>Transit time increasing</b>			
	Block: LS_TRD	Read/write capability: R	Supported modes: – DD: RUNTIME_ON	
	→ Local operation: Code P23			
<b>Operating mode</b>				
	<b>Current operating mode</b>			
	Block: LS_TRD	Read/write capability: R	Supported modes: – DD: CURRENT_OPERATING_MODE	
	<ul style="list-style-type: none"><li>• RUN (operating mode)</li><li>• SET (configuration mode)</li></ul>			
	<b>Reading direction</b>			
	Block: RES	Read/write capability: R/W	Supported modes: O/A	DD: READING_DIRECTION
	<ul style="list-style-type: none"><li>• [0° (normal)]</li><li>• Turned by 180°</li></ul>			
	→ Local operation: Code P1			
	<b>Set operating mode</b>			
	Block: LS_TRD	Read/write capability: R/W	Supported modes: O/M/A	DD: SET_OPERATING_MODE
	<ul style="list-style-type: none"><li>• SET (operating mode)</li><li>• RUN (configuration mode)</li></ul>			
	→ Local operation: Code P2			
<b>Simulation</b>				
	<b>Enable 'Simulation of status and error messages'</b>			
	Block: LS_TRD	Read/write capability: R/W	Supported modes: O/M/A	DD: SIMULATE_STATUS_ERROR_ENABLE

	<b>Simulation of status and error messages</b>		
Block: LS_TRD	Read/write capability: R/W	Supported modes: O/M/A	DD: SIMULATE_STATUS_ERROR
<ul style="list-style-type: none"> <li>• No simulation</li> <li>• E0: No initialization</li> <li>• :</li> <li>• E10: Collective error HW maintenance required</li> <li>• F0: Stationary outside required/desired end position</li> <li>• :</li> <li>• F11: Forced venting active</li> </ul>			

## Diagnostics – Status messages

	<b>Block errors</b>		
Block: DI..._TRD	Read/write capability: R	Supported modes: –	DD: BLOCK_ERR
<b>Block error</b> Block error of the discrete inputs (DI1, TRD ... DI5, TRD) <ul style="list-style-type: none"> <li>• Configuration error</li> <li>• Input error/PV status = BAD</li> <li>• Block mode: out of service</li> </ul>			
Block: DO..._TRD	Read/write capability: R	Supported modes: –	DD: BLOCK_ERR
<b>Block error</b> Block error of the discrete outputs (DO1, TRD ... DO5, TRD) <ul style="list-style-type: none"> <li>• Configuration error</li> <li>• Local override active</li> <li>• Input error/PV status = BAD</li> <li>• Output error</li> <li>• Block mode: out of service</li> </ul>			

## Parameters

<b>Block error</b>	Block: LS_TRD	Read/write capability: R	Supported modes: –	DD: BLOCK_ERR
Block error of the limit switch (LS, TRD)				
<ul style="list-style-type: none"><li>• Local override active</li><li>• Maintenance required soon</li><li>• Input error/PV status = BAD</li><li>• Output error</li><li>• Memory error</li><li>• Data loss in EEPROM</li><li>• Maintenance required now</li><li>• Block mode: out of service</li></ul>				
<b>Block error</b>	Block: RES	Read/write capability: R	Supported modes: –	DD: BLOCK_ERR
Block error of the operating unit (RES, TRD)				
<ul style="list-style-type: none"><li>• Unlock simulation P19 active</li><li>• Maintenance required soon</li><li>• Data loss in EEPROM</li><li>• Maintenance required now</li><li>• Block mode: out of service</li></ul>				
<b>Device error details</b>				
<b>Current device error</b>	Block: LS_TRD	Read/write capability: R	Supported modes: –	DD: ACTUAL_DEVICE_ERROR
<ul style="list-style-type: none"><li>• E0 Device not initialized</li><li>• E1 INIT: actuator does not move</li><li>• E2 INIT: min. travel not reached</li><li>• E3 INIT: max. travel exceeded</li><li>• E4 INIT: actuator travels too fast</li><li>• E5 INIT: forced venting active</li><li>• E6 INIT: time-out</li><li>• E7 Internal error</li><li>• E8 Unable to calibrate end positions</li><li>• E9 Collective error HW failure</li><li>• E10 Collective error HW maintenance required</li></ul>				

	<b>Operating hours since first init (t - ...)</b>			
Block: LS_TRD	Read/write capability: R	Supported modes: –	DD: ERROR..._TIME-STAMP_STRING	
<b>General</b>				
<b>Max. temperature</b>				
Block: LS_TRD	Read/write capability: R	Supported modes: –	DD: MAX_TEMP	
Reading in °C				
<b>Min. temperature</b>				
Block: LS_TRD	Read/write capability: R	Supported modes: –	DD: MIN_TEMP	
Reading in °C				
<b>Movement counter</b>				
Block: LS_TRD	Read/write capability: R	Supported modes: –	DD: STROKE_COUNTER	
• 0 to [10000]; (0 = OFF)				
→ Local operation: Code P26				
<b>Operating hours counter</b>				
Block: LS_TRD	Read/write capability: R	Supported modes: –	DD: ELAPSED_HOUR_METER_STRING	
→ Local operation: Code P25				
<b>Status solenoid valve</b>				
Block: LS_TRD	Read/write capability: R	Supported modes: –	DD: STATUS_MGV	
• Not active internally				
• Active				
• Active (cannot be deactivated internally)				
• Not active				
<b>Temperature</b>				
Block: LS_TRD	Read/write capability: R	Supported modes: –	DD: CURRENT_TEMP	
Reading in °C				
→ Local operation: Code P24				

## Parameters

<b>Time stamp, LCD verification</b>			
Block: LS_TRD	Read/write capability: R	Supported modes: –	DD: TIME STAMP, LCD VERIFICATION
Reading in d.h:min:sec			
<b>Time stamp 'Max. temperature'</b>			
Block: LS_TRD	Read/write capability: R	Supported modes: –	DD: MAX_TEMP_TIME_STAMP_STRING
Reading in d.h:min:sec			
<b>Time stamp 'Min. temperature'</b>			
Block: LS_TRD	Read/write capability: R	Supported modes: –	DD: MIN_TEMP_TIME_STAMP_STRING
Reading in d.h:min:sec			
<b>Transducer error</b>			
Block: LS_TRD	Read/write capability: R	Supported modes: –	DD: XD_ERROR
Error message of LS TRD			

## Status messages details

<b>First occurrence F...</b>			
Block: LS_TRD	Read/write capability: R	Supported modes: –	DD: F..._FIRST_APPEARANCE_STRING
First time when status messages F0 to F10 occurred			
<b>First reset F...</b>			
Block: LS_TRD	Read/write capability: R	Supported modes: –	DD: F..._FIRST_RESET_STRING
First time when status messages F0 to F10 were reset			
<b>Last occurrence F...</b>			
Block: LS_TRD	Read/write capability: R	Supported modes: –	DD: F..._LAST_APPEARANCE_STRING
Last time when status messages F0 to F10 occurred			

<b>Last reset F...</b>	Block: LS_TRD	Read/write capability: R	Supported modes: –	DD: F..._LAST_RESET_STRING
Last time when status messages F0 to F10 were reset				
<b>Qty. F...</b>				
Block: LS_TRD	Read/write capability: R	Supported modes: –	DD: F..._NUMBER	
Number of status messages F0 to F10				
<b>Status messages</b>				
Block:	Read/write capability: R	Supported modes:	DD: ACTUAL_DEVICE_STATUS	
<ul style="list-style-type: none"> <li>• F0 Stationary outside required/desired end position</li> <li>• F1 Left end position without being required to move</li> <li>• F2 Limit for movement counter (P26) exceeded</li> <li>• F3 Temperature limits exceeded</li> <li>• F4 Transit time when required to move exceeded</li> <li>• F5 Actuator stationary when required to move</li> <li>• F6 PST tolerance band not reached</li> <li>• F7 PST tolerance band exceeded</li> <li>• F8 PST: solenoid valve not energized/forced venting active</li> <li>• F9 PST: time-out</li> <li>• F10 Error E0 to E10 exists</li> <li>• F11 Forced venting active</li> </ul>				

## Diagnostics – Monitoring functions

<b>Travel vs time diagram</b>	Block: LS_TRD	Read/write capability: R	Supported modes: –	DD: STB_STR_U16_4
Reading in sec				

## Parameters

	<b>Status of travel vs time diagram</b>
Block:	Read/write capability: R      Supported modes: –      DD: LSTB_STR_U16_3
• Invalid • In progress • Solenoid valve off • Partial stroke test • Solenoid valve on	
<b>Valve movement</b>	
<b>Valve movement (...) beginning</b>	
Block: LS_TRD	Read/write capability: R      Supported modes: –      DD: START_...
Logging of the last ten valve movements – Reading in %	
<b>Valve movement (...) dead time</b>	
Block: LS_TRD	Read/write capability: R      Supported modes: –      DD: DEADTIME_...
Logging of the last ten valve movements – Reading in sec	
<b>Valve movement (...) end</b>	
Block: LS_TRD	Read/write capability: R      Supported modes: –      DD: END_...
Logging of the last ten valve movements – Reading in %	
<b>Valve movement (...) status</b>	
Block: LS_TRD	Read/write capability: R      Supported modes: –      DD: STATUS_...
Logging of the last ten valve movements	
<b>Valve movement (...) time stamp</b>	
Block: LS_TRD	Read/write capability: R      Supported modes: –      DD: TIME_STAMP_... TIME_STAMP_STR_...
Logging of the last ten valve movements	
<b>Valve movement (...) transit time</b>	
Block: LS_TRD	Read/write capability: R      Supported modes: –      DD: RUNTIME_...
Logging of the last ten valve movements – Reading in sec	

## Diagnostics – Test functions

### Configuration of partial stroke test (PST)

<b>Interval for PST</b>	Block: LS_TRD	Read/write capability: R/W	Supported modes: O/M/A	DD: PST_TIME_INTERVAL
<ul style="list-style-type: none"> <li>• 0 to 999 days</li> </ul>				→ Local operation: Code P16
<b>PST command</b>	Block: LS_TRD	Read/write capability: R/W	Supported modes: –	DD: PST_CMD
<ul style="list-style-type: none"> <li>→ Local operation: Code P17</li> </ul>				
<b>PST step end</b>	Block: LS_TRD	Read/write capability: R/W	Supported modes: O/M/A	DD: PST_TARGET_MIN_VALUE
<ul style="list-style-type: none"> <li>• 4.0 to 96.0 %, [90.0 %]</li> </ul>				→ Local operation: Code P14
<b>PST tolerance band</b>	Block: LS_TRD	Read/write capability: R/W	Supported modes: O/M/A	DD: PST_TARGET_MAX_VALUE
<ul style="list-style-type: none"> <li>• 4.0 to 96.0 %, [10.0 %]</li> </ul>				→ Local operation: Code P14
<b>Partial stroke test (PST) logging</b>				
<b>No. of PSTs performed</b>	Block: LS_TRD	Read/write capability: R	Supported modes: –	DD: NUMBER_PST

## Parameters

<b>PST dead time (...)</b>
